# Disclaimer

This is a comprehensive report based on our automated and manual examination of cybersecurity vulnerabilities and framework flaws. We took into consideration smart contract based algorithms, as well. Reading the full analysis report is essential to build your understanding of project's security level. It is crucial to take note, though we have done our best to perform this analysis and report, that you should not rely on the our research and cannot claim what it states or how we created it. Before making any judgments, you have to conduct your own independent research. We will discuss this in more depth in the following disclaimer - please read it fully.

DISCLAIMER: You agree to the terms of this disclaimer by reading this report or any portion thereof. Please stop reading this report and remove and delete any copies of this report that you download and/or print if you do not agree to these conditions. This report is for non-reliability information only and does not represent investment advice. No one shall be entitled to depend on the report or its contents, and Soken and its affiliates shall not be held responsible to you or anyone else, nor shall Soken provide any guarantee or representation to any person with regard to the accuracy or integrity of the report. Without any terms, warranties or other conditions other than as set forth in that exclusion and Soken excludes hereby all representations, warrants, conditions and other terms (including, without limitation, guarantees implied by the law of satisfactory quality, fitness for purposes and the use of reasonable care and skills). The report is provided as "as is" and does not contain any terms and conditions. Except as legally banned, Soken disclaims all responsibility and responsibilities and no claim against Soken is made to any amount or type of loss or damages (without limitation, direct, indirect, special, punitive, consequential or pure economic losses or losses) that may be caused by you or any other person, or any damages or damages, including without limitations (whether innocent or negligent).

Security analysis is based only on the smart contracts. No applications or operations were reviewed for security. No product code has been reviewed.

# Procedure

## Our analysis contains following steps:

1. Project Analysis;
2. Manual analysis of smart contracts:
  - Deploying smart contracts on any of the network(Ropsten/Rinkeby) using Remix IDE
  - Hashes of all transaction will be recorded
  - Behaviour of functions and gas consumption is noted, as well.
3. Unit Testing:
  - Smart contract functions will be unit tested on multiple parameters and under multiple conditions to ensure that all paths of functions are functioning as intended.
  - In this phase intended behaviour of smart contract is verified.
  - In this phase, we would also ensure that smart contract functions are not consuming unnecessary gas.
  - Gas limits of functions will be verified in this stage.
4. Automated Testing:
  - Mythril
  - Oyente
  - Manticore
  - Solgraph

# Terminology

**We categorize the finding into 4 categories based on their vulnerability:**

- Low-severity issue — less important, must be analyzed
- Medium-severity issue — important, needs to be analyzed and fixed
- High-severity issue — important, might cause vulnerabilities, must be analyzed and fixed
- Critical-severity issue — serious bug causes, must be analyzed and fixed.

## Limitations

The security audit of Smart Contract cannot cover all vulnerabilities. Even if no vulnerabilities are detected in the audit, there is no guarantee that future smart contracts are safe. Smart contracts are in most cases safeguarded against specific sorts of attacks. In order to find as many flaws as possible, we carried out a comprehensive smart contract audit. Audit is a document that is not legally binding and guarantees nothing.

# Token Contract Details for 18.10.2021

Contract Name: **MuskToken**

Deployed address: **0x184079Ca987F562ae6a0c59f4BE5cADB20323863**

Total Supply: **1,000,000,000,000,000**

Token Tracker: **MARSRISE**

Decimals: **9**

Token holders: **15,289**

Transactions count: **41,344**

Top 100 holders dominance: **84.84%**

## Audit Details

Project Name: **MarsRise**

Language: **Solidity**

Compiler version: **v.0.8.4**

Blockchain: **BSC**

# Vulnerabilities checking

| Issue Description                    | Checking Status |
|--------------------------------------|-----------------|
| Compiler Errors                      | Completed       |
| Delays in Data Delivery              | Completed       |
| Re-entrancy                          | Completed       |
| Transaction-Ordering Dependence      | Completed       |
| Timestamp Dependence                 | Completed       |
| Shadowing State Variables            | Completed       |
| DoS with Failed Call                 | Completed       |
| DoS with Block Gas Limit             | Low-issues      |
| Outdated Compiler Version            | Completed       |
| Assert Violation                     | Completed       |
| Use of Deprecated Solidity Functions | Completed       |
| Integer Overflow and Underflow       | Completed       |
| Function Default Visibility          | Completed       |
| Malicious Event Log                  | Completed       |
| Math Accuracy                        | Completed       |
| Design Logic                         | Completed       |
| Fallback Function Security           | Completed       |
| Cross-function Race Conditions       | Completed       |
| Safe Zeppelin Module                 | Completed       |

# Security Issues

## 1) Owner privileges:

The contract contains ownership functionality and ownership is not renounced which allows the creator or current owner to modify contract behavior (for example, disable selling or mint new tokens).

## 2) Out of Gas issue:

The function `includeInRewards()` uses the loop to find and remove addresses from the `_excluded` list. Function will be aborted with `OUT_OF_GAS` exception if there will be a long excluded addresses list.

```

628 ~   function includeInReward(address account) external onlyOwner() {
629       require(!_isExcluded[account], "Account is already excluded");
630 ~       for (uint256 i = 0; i < _excluded.length; i++) {
631 ~           if (_excluded[i] == account) {
632               _excluded[i] = _excluded[_excluded.length - 1];
633               _tOwned[account] = 0;
634               _isExcluded[account] = false;
635               _excluded.pop();
636               break;
637           }
638       }
639   }

```

## 3) Out of Gas issue:

The function `_getCurrentSupply` also uses the loop for evaluating total supply. It also could be aborted with `OUT_OF_GAS` exception if there will be a long excluded addresses list.

```

848 ~   function _getCurrentSupply() private view returns(uint256, uint256) {
849       uint256 rSupply = _rTotal;
850       uint256 tSupply = _tTotal;
851 ~       for (uint256 i = 0; i < _excluded.length; i++) {
852           if (_rOwned[_excluded[i]] > rSupply || _tOwned[_excluded[i]] > tSupply) return (_rTotal, _tTotal);
853           rSupply = rSupply.sub(_rOwned[_excluded[i]]);
854           tSupply = tSupply.sub(_tOwned[_excluded[i]]);
855       }
856       if (rSupply < _rTotal.div(_tTotal)) return (_rTotal, _tTotal);
857       return (rSupply, tSupply);
858   }

```

## Recommendation:

Use `EnumerableSet` instead of array or do not use long arrays.

# Conclusion

Low-severity issues exist within smart contracts. Smart contracts are free from any critical or high-severity issues.

NOTE: Please check the disclaimer above and note, that audit makes no statements or warranties on business model, investment attractiveness or code sustainability.
